## **BEST AVAILABLE IMAGES**

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images include but are not limited to the items checked:

BLACK BORDERS
IMAGE CUT OFF AT TOP, BOTTOM OR SIDES
FADED TEXT OR DRAWING
BLURRED OR ILLEGIBLE TEXT OR DRAWING
SKEWED/SLANTED IMAGES
COLOR OR BLACK AND WHITE PHOTOGRAPHS
GRAY SCALE DOCUMENTS
LINES OR MARKS ON ORIGINAL DOCUMENT
REFERENCE(S) OR EXHIBIT(S) SUBMITTED ARE POOR QUALITY

# IMAGES ARE BEST AVAILABLE COPY.

OTHER:

As rescanning these documents will not correct the image problems checked, please do not report these problems to the IFW Image Problem Mailbox.

## United States Patent and Trademark Office

#### Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 06/16/2004 has been entered.

#### Claim Objections

2. Claim 1 and 9 are objected to because of the following informalities:

Claims 1 and 9 recite the limitation "the steps". There is insufficient antecedent basis for this limitation in the claim. Appropriate correction is required.

### Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1-8 and 15-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Chapman (US 6,438,123 B1) in view of Geiger et al. (Geiger) (US 5,978,022).

Art Unit: 2155

Regarding claim 1, Chapman teaches a method for transmitting data over a Data Over Cable Service Interface Specification (DOCSIS) network (col. 3 lines 50-58), comprising the steps of:

communicating a unique index number assigned to header suppression to a cable modem termination system (col. 4 lines 60-67);

receiving a plurality of data packets to be transmitted (col. 12 lines 47-48); identifying which of the received data packets have a header that should be suppressed (col. 12 lines 20-21);

appending a packet header element to each of the identified data packets, the packet header element containing the index number assigned to the header suppression of the identified data packets (col. 12 lines 27-30); and

suppressing a header of each of the identitied data packets using the header suppression technique (col. 6 lines 14-19).

Chapman does not explicitly teach a plurality of header suppression techniques.

Geiger, in the same field of endeavor, teaches a plurality of header suppression techniques (i.e., use first header compression technique 407, second header compression technique 411, and third compression technique 417, Fig. 4); and selecting a header suppression technique from the plurality of header suppression techniques for each of the identified data packets (col. 3 lines 7-10). It would have been obvious to one having ordinary skill in the art at the time the invention was made to have utilized a plurality of header suppression techniques of Geiger in the process of header suppressing in

Art Unit: 2155

Chapman because such plurality of suppression techniques enable data packet(s) to be selectively encoded using one of a headers suppression techniques, thereby allowing maximum performance (Geiger, col. 5 line 14).

Regarding claim 2, Chapman-Geiger teaches concatenating each data packet within a single DOCSIS transmit burst to form a mixed protocol burst, and transmitting the mixed protocol burst to the cable modern termination system (Chapman, col. 8 lines 7-39).

Regarding claim 3, Chapman-Geiger each of the received data packets that are unknown Internet Protocol (IP) packets are identified as having a header that should be suppressed in said identifying step (Chapman, col. 6 lines 14-27).

Regarding claim 4, Chapman/Mahler teaches DOCSIS payload header compression is selected (Chapman, see col. 11 lines 47-54).

Regarding claim 5, Chapman-Geiger teaches each of the received data packets that are IP/RTP packets with dynamically changing pattern are identified having a header that should be suppressed (Chapman, see col. 6 lines 20-27).

Regarding claim 6, Chapman-Geiger teaches RTP suppression is selected for each of the received data packets that are IP/RTP packets with dynamically changing patterns (Chapman, e.g., see col. 6 lines 20-27 and lines 37-42).

Regarding claim 7, Chapman-Geiger teaches each of the received data packets that are IP/TCP variable length packets are identified as having a header that should be suppressed (Geiger, col. 1 lines 56-59).

Art Unit: 2155

Regarding claim 8, Chapman-Geiger teaches dynamic delta encoding suppression is selected for each of packets that are IP/TCP variable length (col. 5 lines 5 lines 28-42).

Regarding claim 15, Chapman teaches a system for transmitting data over a Data Over Cable Service Interface Specification (DOCSIS) network (col. 3 lines 50-58), comprising:

one or more cable modems that suppress data packet headers by using header suppression technique (col. 6 lines 14-19); and

a cable modem termination system (CMTS) enabled to expand said data packet headers by using a set of expansion rules corresponding header suppression technique (col. 6 lines 28-36), wherein said one or more cable modems assigns a unique index number to a header suppression (col. 6 lines 46—col. 7 lines 6).

Chapman does not explicitly teach a plurality of header suppression techniques.

Geiger, in the same field of endeavor, teaches a plurality of header suppression techniques (i.e., use first header compression technique 407, second header compression technique 411, and third compression technique 417, Fig. 4 ); selecting one of the plurality of header suppression technique (col. 3 lines 7-10). It would have been obvious to one having ordinary skill in the art at the time the invention was made to have utilized a plurality of header suppression techniques of Geiger in the process of header suppressing in Chapman because such plurality of suppression techniques enable data

Art Unit: 2155

packet(s) to be selectively encoded using one of a headers suppression techniques, thereby allowing maximum performance (Geiger, col. 5 line 14).

Regarding claim 16, Chapman-Geiger teaches one or more cable modems appends a packet header element to each data packet having a suppressed header, packet header element includes said one or more index number assigned to the header suppression technique used to suppress each data packet (Chapman, e.g., see col. 6 lines 46-62).

Regarding claim 17, Chapman-Geiger teaches one or more cable modems concatenates each data packet having a suppressed header into to a single DOCSIS transmit burst, and to form a mixed protocol burst (Chapman, e.g., see col. 8 lines 33-52).

4. Claims 9-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Chapman (US 6,438,123 B1) in view of Geiger et al. (Geiger) (US 5,978,022) in further view of Mahler et al. (Mahler) (US 6,542,504 B1).

Regarding claim 9, Chapman teaches method for expanding data packet headers transmitted over a Data Over Cable Service Interface Specification (DOCSIS) network (Fig. 6), comprising the steps of:

receiving a mixed protocol burst comprising a plurality of data packets having headers suppressed in accordance with a header suppression technique (col. 6 line 44-col. 7 line 6).

identifying each data packet within the mixed protocol burst that has a suppressed header (col. 6 lines 46-53);

Art Unit: 2155

Chapman does not explicitly teach a plurality of header suppression techniques and expanding scheme as claimed.

Geiger, in the same field of endeavor, teaches a plurality of header suppression techniques (i.e., use first header compression technique 407, second header compression technique 411, and third compression technique 417, Fig. 4 col. 3 lines 7-10). It would have been obvious to one having ordinary skill in the art at the time the invention was made to have utilized a plurality of header suppression techniques of Geiger in the process of header suppressing in Chapman because such plurality of suppression techniques enable data packet(s) to be selectively encoded using one of a headers suppression techniques, thereby allowing maximum performance (Geiger, col. 5 line 14).

Mahler, in the same field of endeavor, teaches searching a lookup table to select a set of rules from a plurality of sets of rules for expanding a suppressed header of each of data packets, and expanding a suppressed header of each of the data packets identified according to a set of rules identified (e.g., see col. 6 lines 17-23 and col. 14 line 10-col. 16 line 30). It would have been obvious to a person of ordinary skill in the art at the time the invention was made to have utilized the header expanding scheme of Mahler in the process of header desuppressing in Chapman because such a header expanding scheme would use only a small amount of state and require no update state between endpoints. Thus, packets would have been efficiently transmitted between two link terminators (Mahler, col. 3 line 19-20).

Art Unit: 2155

Regarding claim 10, Chapman-Geiger-Mahler teaches an appended header element containing an index number (Chapman, e.g., see col. 6 line 63-col. 7 line12).

Regarding claim 11, Chapman-Geiger-Mahler teaches using index numbers contained in each appended packet header element to search the lookup table (see Chapman e.g., see col. 4 lines 65-67).

Regarding claim 12, Chapman-Geiger-Mahler discloses DOCSIS protocol header expansion rules are used (Chapman, e.g., see col. 11 lines 52-54).

Regarding claim 13, Chapman-Geiger-Mahler discloses RTP expansion rules are used (Chapman, e.g., see col. 6 line 14-col. 7 line12).

Regarding claim 14, Chapman-Geiger-Mahler teaches expanding a suppressed header (Chapman, col. 6 lines 17-19), and Dynamic delta encoding rule are used for IP/TCP variable length packets (Geiger, col. 5 lines 27-42).

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Oanh L. Duong whose telephone number is (703) 305-0295. The examiner can normally be reached on Monday- Friday, 8:00AM - 5:30PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Hosain T. Alam can be reached on (703) 308-6662. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
